Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)
	09/856,813	YESBURG, JOHN DESBOROUGH
Examiner	Art Unit	
Carl Colin	2136	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1) Responsive to communication(s) filed on 05 October 2005 .

2a) This action is FINAL. 2b) This action is non-final.

3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4) Claim(s) 1-12 and 14-24 is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5) Claim(s) _____ is/are allowed.

6) Claim(s) 1-12 and 14-24 is/are rejected.

7) Claim(s) _____ is/are objected to.

8) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9) The specification is objected to by the Examiner.

10) The drawing(s) filed on _____ is/are: a) accepted or b) objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

11) The proposed drawing correction filed on 09 March 2005 is: a) approved b) disapproved by the Examiner.

If approved, corrected drawings are required in reply to this Office action.

12) The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

13) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a) All b) Some * c) None of:

1. Certified copies of the priority documents have been received.
2. Certified copies of the priority documents have been received in Application No. _____ .
3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

14) Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).

a) The translation of the foreign language provisional application has been received.

15) Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

1) <input checked="" type="checkbox"/> Notice of References Cited (PTO-892)	4) <input type="checkbox"/> Interview Summary (PTO-413) Paper No(s). _____ .
2) <input type="checkbox"/> Notice of Draftsperson's Patent Drawing Review (PTO-948)	5) <input type="checkbox"/> Notice of Informal Patent Application (PTO-152)
3) <input type="checkbox"/> Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____ .	6) <input type="checkbox"/> Other: _____ .

DETAILED ACTION

Response to Arguments

1. In response to communications filed on 10/5/2005, for a request to continue examination, applicant amends claims 1-12, 14-18, 20-23, and adds claim 24. The following claims 1-12 and 14-24 are presented for examination.

2. Applicant's arguments, pages 8-17, filed on 10/5/2005, with respect to the rejection of claims 1-23 have been fully considered, but they are not persuasive. Regarding claim 1, applicant has amended the claimed digital data by adding digital data including document. Note that Applicant's claimed "digital data" is described in the disclosure (page 12, last paragraph) as "any data, which may be for example a shopping order list, a military command to fire a missile, or a contract". Applicant argues that the present invention is distinct from the prior art because the prior art does not display a document. Examiner respectfully disagrees. Wang discloses electronic transaction data that includes at least purchase transaction, bank transaction, library materials transaction, financial transactions, vendor/user transaction etc. (see column 1, lines 13-35) that meets the recitation of data including document as claimed in claim 1. Applicant adds that Wang does not teach displaying complete detail of the document. In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., Wang does not teach displaying complete detail of the document) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In*

re Van Geuns, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993). As mentioned above, Applicant's disclosure at the time the invention was made was not focusing on the type of data to be signed, but any digital data or document. With respect to claims 2, 3, 9, and 15-16, in response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986). Applicant has amended the claims to further limit some of the claims. Upon further consideration, a new ground of rejection is made to claims 6-8. Other claims still remain rejected in view of the same references.

Specification

3. The amendment filed 3/9/2005 is objected to under 35 U.S.C. 132(a) because it introduces new matter into the disclosure. 35 U.S.C. 132(a) states that no amendment shall introduce new matter into the disclosure of the invention. The added material which is not supported by the original disclosure is as follows: "prevents the user from authorizing and digitally signing any data unless it is viewable on the trusted display", page 2 of 17 of the amendment. Applicant is required to cancel the new matter in the specification.

Claim Rejections - 35 USC § 112

4. The following is a quotation of the first paragraph of 35 U.S.C. 112:
The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any

person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

4.1 Claims 4, 5, and the intervening claims are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim contains subject matter, which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Applicant's disclosure fails to recite signed data is not transmitted external until said audit means audits the signing performed by said cryptographic engine and signed data is not displayed by said trusted display until said audit means audits the signing performed by said cryptographic engine. The specification, on the other hand, merely describes an audit log as information representative of the transactions performed by the PKPD.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5.1 **Claims 1, 4-5, 10, 14, 17-23** are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,917,913 to **Wang** in view of US Patent 6,092,202 to **Veil et al.**

5.2 **As per claim 1, Wang** discloses a digital private key protection device, comprising a digital private key storage means containing a user's digital private key, for example (see column 9, lines 5-20); a cryptographic engine, for example (see column 9, lines 1-6); a communications port for receiving digital data including a document from an external device, and for transmitting data to said external device, for example (see column 9, lines 20-40; column 1, lines 13-35); a display means for displaying said received digital data, for example (see column 10, line 65 through column 11, 12); a user operable input means connected to said cryptographic engine to indicate when operated by said user their approval of said displayed received digital data, for example (see column 11, lines 14-41; column 10, lines 36-67); wherein said cryptographic engine for processing digital data and one or more digital keys is trusted to only apply said user's digital private key to sign said received data only if said user operable input means is operated and communicate said signed data external of said digital private key protection device, for example (see column 11, lines 33-62 and column 4, lines 40-65). **Wang** does not explicitly disclose a trusted display. **Veil et al** in an analogous art discloses a trusted display for displaying true transaction information (see abstract). **Veil et al** discloses that the present invention displays transaction information that has been authenticated as true transaction information; and the trusted display can optionally be separate so that the user can visually see a conflict between a correct and false transaction and alerts user to a possible tampering or attack (column 7, line 50

through column 8, line 33). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the display of **Wang** to provide the user with a trusted display that displays transaction information that has been authenticated as true transaction information; and the trusted display can optionally be separate so that the user can visually see a conflict between a correct and false transaction and alerts user to a possible tampering or attack as taught by **Veil et al**. One of ordinary skill in the art would have been lead to make such a modification to guarantee that a transaction displayed represents the true information as suggested by **Veil et al** (column 7, line 50 through column 8, line 33).

As per claim 4, Wang discloses the limitation of an audit means meets the recitation of wherein signed data is not transmitted external of said digital private key protection device until said audit means audits the signing performed by said cryptographic engine, for example (see column 7, lines 1-17 and column 12, lines 35-50; column 4, lines 40-55). **Want** discloses a means of recording all transaction approvals so that is able to know when transaction has been approved, how many times it has been approved, duplicate transaction approval data, etc.

As per claim 5, Wang discloses the limitation of an audit means that meets the recitation of wherein signed data is not displayed until a said encryption process is audited by said audit means, for example (see column 7, lines 1-17 and column 12, lines 35-50).

As per claim 10, Wang discloses the limitation of wherein said cryptographic engine is trusted to decrypt digital data using said user's digital private key and passing decrypted digital

data to said display means for display of said received digital data, for example (see column 7, lines 42-61).

As per claim 14, Veil et al discloses wherein said digital private key storage means also contains a digital shared secret symmetric key wherein said cryptographic engine is trusted to only apply said digital shared secret symmetric key to encrypt data only if said user operable input means is operated and also trusted to communicate said encrypted data external of said digital private key protection device (column 5, line 55 through column 6, line 16 and column 11, line 29-67). **Veil et al** discloses a user PIN to unlock the private key and authorizes use of sensitive data if verified that meets the recitation of user operable input means. Wang also discloses another input means using a switch. Therefore, claim 14 is rejected on the same rationale as the rejection of claim 1.

As per claims 17-21, the combination of Wang and Veil et al discloses the limitation of wherein said trusted display means is external to said device and controlled by said device for displaying data transmitted from said communications port in a trusted manner wherein said digital private key storage means is removable from said device (see Veil, column 7, lines 58-60 and drawings); wherein said user operable input means is external to said device and controlled by said device to be actuated by said user in a predetermined manner; further comprising identification and authentication means actuated by said user in a predetermined manner; an audit means which audits said actuation of said user operable input means (Wang, column 4, lines 40-67 and column 10, line 55 through column 11).

As per claims 22-23, the combination of **Wang and Veil et al** discloses a digital private key protection device according to claim 1, wherein a cryptographic request is received from said external device according to a predetermined application programming interface, such that the request is performed by said digital private key protection device using the user's private or other keys as identified by the request, but excluding any private keys associated with the private key protection device with the result being transmitted to said external device or a predetermined destination included in said request or otherwise predetermined, wherein said device displays a description of said request to the user and, only if the user operates said user operable input means, does said device carry out said request (Wang, column 11, lines 33-67 and Veil, column 7, line 35 through column 8, line 33).

As per claim 24, the combination of **Wang and Veil et al** discloses a digital private key protection device according to claim 1, wherein the digital key storage is adapted to allow removal of the user's digital keys from the digital key protection device (see **Veil et al**, column 6, lines 8-34). Therefore, claim 24 is rejected on the same rationale as the rejection of claim 1.

6. **Claims 2, 3, 9, and 15-16** are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,917,913 to **Wang** in view of US Patent 6,092,202 to **Veil et al** as applied to claim 1 and further in view of **Bruce Schneier**, Applied Cryptography, 1996, John Wiley & Sons, Second Edition, Pages 43-44.

6.1 **As per claims 2, 3, 9, and 15-16, Wang** substantially teaches the claimed method of claim 1 and discloses that the invention is not limited to any encryption scheme, for example (see column 5, lines 35-50). **Wang** discloses that the received data can be encrypted using a trusted public and private key, for example (see column 7, lines 18-67). **Veil et al** discloses proving electronic transactions performed by a cardholder and discloses verifying whether a user is authorized to conduct a transaction to prevent repudiation (column 11, line 45 through column 12, line 14 and columns 5-6); and further discloses a trusted display for verification of transaction information as discussed above in claim 1. **Veil et al** discloses transaction data including a certificate created using a user's private key (column 11, lines 22-45). The limitation of received data that includes instructions to determine which protocol to use to communicate or keys to use for encryption is well known in packet processing and can be also found in **Schneier** textbook. Neither of the references explicitly teaches validating signature of a user's public key from a plurality of public keys and decrypts data using the verified public key. **Schneier** in an analogous art teaches a key certification authority wherein the users' public keys are signed with a trusted private key to prevent attack against public key, for example (see pages 43, 62-64); and further discloses validating signature of said user's public key with said trusted public key to determine the veracity of said user's public key and then decrypts said received data using said verified predetermined user's public key, for example (see pages 43, 62-64). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method as combined above to store user's public keys and have the public keys signed by a trusted private key using public/private key pairs as taught by **Schneier**. This modification would have been obvious because one skilled in the art would have been motivated

by the suggestions provided by **Schneier** to have a card that can be used by more than one user and prevent attack against public key and prevents users from repudiation as it proves proof of user's participation.

7. **Claims 11-13** are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,917,913 to **Wang** in view of US Patent 6,092,202 to **Veil et al** as applied to claim 1 and further in view of US Patent 5,742,756 to **Dillaway et al**.

7.1 **As per claim 11-13, Wang** discloses a user may activate a button to create a transaction approval and message encrypted or decrypted to be transmitted unless said user operable input means is operated (column 11, lines 40-55). **Veil et al** discloses encryption decryption of transaction and further discloses sensitive data remains resident in protected device (column 11, lines 1-8). Neither of the references explicitly states decrypted information is not released external to said device unless said user operable input means is operated. **Dillaway et al** in an analogous art teaches security and authentication and digital signature performed by a smart card and discloses to provide a higher degree of security users can be required to provide password or wait for user presence signal before performing any security critical operations (column 5, line 50 through column 6, line 30). Transmitting decrypting information outside of the card is a security critical operation to one skilled in the art. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method as combined above to activate the approval button of Wang before decrypted information is released external to said device to confirm the presence of the user as taught by **Dillaway et al**. One of ordinary

skill in the art would have been lead to make such a modification to confirm the presence of the user before performing a security critical operation as suggested by **Dillaway et al** (column 5, line 50 through column 6, line 30).

8. **Claims 6-8** is rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,917,913 to **Wang** in view of US Patent 6,092,202 to **Veil et al** as applied to claim 1 and further in view of US Patent 6,408,388 **Fisher**.

As per claim 6, both references disclose the claimed method of claim 1. Neither of the references discloses multiple signatures. However, **Fisher** in an analogous art discloses a method of ensuring that both the device producing the signature and the user signing the digital data can be trusted by performing multiple signatures wherein data is signed with the user's private key and is further signed with the device private key and further signing the data with the user's private key (column 6, lines 25-40 and column 8, lines 10-21). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method as combined above to store a digital private key of the device wherein digital data signed by the protection device is further signed by the private key of the protection device as taught by **Fisher**. One of ordinary skill in the art would have been lead to make such a modification because the implementation of multiple signature provides further security and trust such that both the device producing the signature and the entity can be trusted and validated as the data is signed twice with the device's key and the user's or authority's key as suggested by **Fisher** (column 6, lines 25-40).

As per claims 7-8, Veil et al discloses use of public/private key pair for decrypting data that has been encrypted at the other end using the corresponding public or private key from the key pair (column 5, lines 48 through column 6, line 16 and discloses trusted display for verification (claim 1). **Fisher** discloses verification of signature signed by a private key using public key (column 6, line 25 through column 7, line 7). Therefore, claims 7-8 are rejected on the same rationale as the rejection of claims 1 and 6.

Conclusion

9. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure as the art protection device to protect private keys of users and several cryptographic schemes to verify signatures and key used. Many of the claimed features are disclosed in these references.
